# TENTH ANNUAL TOXIC CHEMICAL REPORT

A summary of information contained in the Toxic Chemical Report Forms for calendar year 1996

JULY 1998

Illinois Environmental Protection Agency Springfield, Illinois THIS PAGE INTENTIONALLY LEFT BLANK

## PREFACE

This tenth anniversary of the Toxics Release Inventory reporting program, required under the federal Emergency Planning and Community Right-to-Know Act of 1986, is heralded by the seventh consecutive annual decrease in reported toxic chemical releases from Illinois facilities, and the ninth decrease in ten years. As reported by the United States Environmental Protection Agency in their 1996 Toxics Release Inventory Public Data Release, the decrease in on- and offsite releases by Illinois facilities from 1995 to 1996 ranks third in the nation.

The Illinois EPA, reporting facilities and the citizens of Illinois can all be proud of this significant accomplishment in toxics release reduction. The Toxics Release Inventory data continues to indicate a positive outcome of the combined efforts of the Illinois EPA in administration of release prevention and regulation programs, reporting facilities in their efforts to comply with mandatory and voluntary programs to achieve reductions, and citizens empowered by the data who demand a cleaner environment. This success story will continue through the efforts of all stakeholders to support and improve this remarkable program.

Mary A. Gade, Director

Illinois EPA

## **EXECUTIVE SUMMARY**

More than 2,000 unique facilities have reported toxic chemical release information to the Illinois EPA since the reporting program mandated by federal law began in 1987. Not including 1987, an average of 1,327 facilities have reported each year, with the actual number ranging between 1,128 and 1,395.

For calendar year 1996, 1,128 facilities submitted 3,602 individual toxic chemical release reports showing a total of 133.9 million pounds of releases and transfers. Zinc compounds had the highest reported releases and transfers, at 24.2 million pounds. The combined total of fugitive and stack air emissions topped all other environmental areas at 68.3 million pounds. Facilities in Standard Industrial Classification (SIC) Code 3312 (steel works, blast furnaces, coke ovens and rolling mills) exceeded all other industrial categories with reported releases and transfers of 30.4 million pounds.

In order to perform meaningful trend analyses of total toxic chemical releases, including offsite transfers, the Illinois EPA utilizes information reported by facilities for toxic chemicals which have been reportable in the same form for each of the years 1988-1996. Offsite transfers for recycle or energy recovery, reportable for 1991 and later years, are not considered. Seven hundred ninety-eight facilities have reported every year from 1988-1996, which represent approximately 60 percent of all facilities reporting on an annual average basis. These facilities report approximately 82 percent of total releases each year. From 1988 through 1996, total releases for all reporting facilities have decreased by 42 percent while total releases for the 798 facilities have decreased by 37 percent.

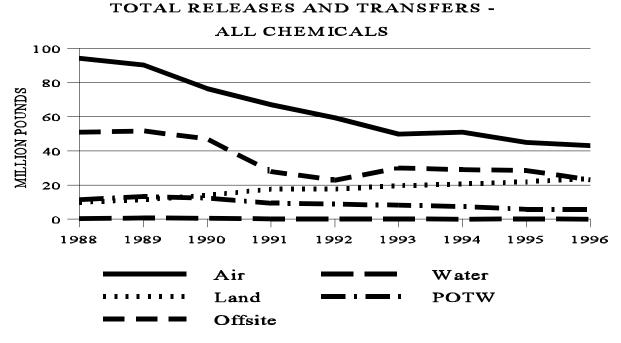

The toxic chemical with the greatest amount of releases from 1988 through 1996 was zinc compounds, totalling 167.4 million pounds. Considering only those toxic chemicals with significant human health effects, i.e. which are known or probable human carcinogens, teratogens, fetal toxicants and/or reproductive toxicants, toluene had the highest total of 107.7 million pounds.

The group of facilities in SIC Code 3312 reported 253.2 million pounds of releases from 1988 through 1996, the greatest for any industrial category, and also had the highest total of 80.8 million pounds in the period for those toxic chemicals with significant human health effects.

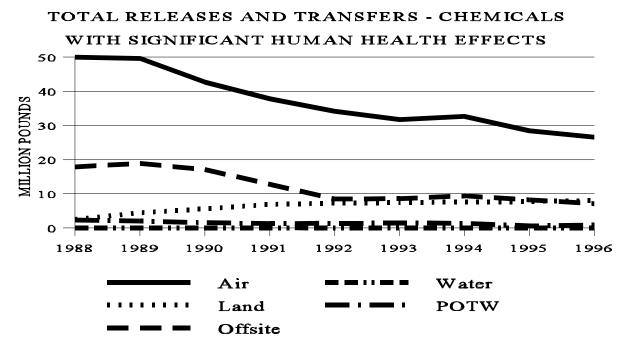

Facilities located in ZIP Code 61953 in Douglas County reported the highest total of air emissions from 1988 through 1996, totalling 33.3 million pounds. Considering only those toxic chemicals with significant human health effects, facilities located in ZIP Code 61832 in Vermilion County reported the highest total of 31.2 million pounds.

Overall, total air emissions, discharges to water, and offsite transfers continue to decrease, while onsite releases to land continue to increase.

By popular request, a list of total releases and number of facilities for counties with reporting facilities has been included as Appendix E.

\* Underground Injection is virtually zero for all years.

\* Underground Injection is virtually zero for all years.

## **INTRODUCTION**

## EMERGENCY PLANNING AND COMMUNITY RIGHT-TO-KNOW ACT

Congress adopted Title III as part of the Superfund Amendments and Reauthorization Act of 1986 (SARA). Title III is known as the Emergency Planning and Community Right-to-Know Act of 1986 (EPCRA). EPCRA establishes programs to provide the public with important information on the hazardous chemicals in their communities, as well as providing emergency planning and notification requirements which help protect the public in the event of a release of hazardous chemicals.

#### SECTION 313 (Annual Toxic Chemical Release Reporting)

Section 313 of EPCRA requires annual reports to be filed by certain companies which release any of over 600 listed toxic chemicals and compounds to the environment. This reporting covers routine releases that occur as a result of normal business operations within a calendar year, and non-routine or accidental releases.

In 1987, the Illinois General Assembly amended the Illinois Environmental Protection Act to provide for a coordinated state implementation of Section 313. This amendment also established an orderly procedure for the public to access this information. Under the Act, the Illinois Environmental Protection Agency (IEPA) is charged with the administration of Section 313 which requires industry to report annually to the U.S. EPA and state governments via the toxic chemical release form (Form R).

Form R includes all routine and non-routine releases of toxic chemicals to the air, water and land, as well as transfers of wastes to off-site treatment, storage and disposal facilities. The information reported is not necessarily derived from actual monitoring or measurements, but may be estimated from published emission factors, material balance calculations, or engineering calculations.

Form R information reported to the Illinois EPA is entered into a computer data base known as the Illinois Toxic Chemical Inventory (TCI), as required by the Illinois Environmental Protection Act.

### SUMMARY OF FORM R

A complete copy of Form R is enclosed as Appendix A. In general, the information to be provided by the reporting facility can be summarized as follows:

- The name, location and type of business
- Whether the chemical is manufactured, processed, or otherwise used and the general categories of use of the chemical
- An estimate of the maximum amounts of the toxic chemical present at the facility at any time during the preceding year
- Waste treatment/disposal methods and efficiency of methods for each wastestream
- Quantity of the chemical entering each environmental medium (air, water, land) annually
- Source reduction and recycling activities for the toxic chemical
- A certification by a senior official that the report is complete and accurate

#### **EXPLANATION OF TERMS**

In order to better understand the form and references made to the information reported, selected terms have been defined as follows:

"SIC Code" - A two, three or four digit number code designated by the federal Office of Management and

Budget in its "SIC Manual" which identifies an industry or industrial grouping. For example, the two-digit code "28" refers to the major group, "Chemicals and Allied Products," the three-digit "281" refers to the industry group, "Industrial Inorganic Chemicals," and the four-digit code "2812" refers to the specific industry, "Alkalies and Chlorine." The four-digit code identifies a specific facility rather than company.

"Publicly Owned Treatment Works (POTW)" - A wastewater treatment facility which is owned by a unit of government.

"Off-Site Locations" - Locations outside the boundaries of a facility to which wastes are transported for treatment or disposal.

"Chemical Abstracts Service Registry Number (CAS #)" - A numeric designation assigned by the American Chemical Society's Chemical Abstracts Service which uniquely identifies a chemical or chemical compound.

"Fugitive or non-point air emissions" - Releases to the air that are not conveyed through stacks, vents, pipes, ducts or any other confined air stream. Examples include leakage from valves, pump seals, flanges, compressors, sampling connections, open ended lines, evaporative losses from surface impoundments and production lines, and releases from building ventilation systems.

"Stack or point air emissions" - Releases to the air which are conveyed through stacks, vents, ducts, pipes or other confined air streams, and includes storage tank emissions and air releases from control equipment.

"**Wastestream**" - An ongoing generation of waste which results from an industrial process or originates in an industrial area and which can be consistently described by the same physical and chemical characteristics.

"**Releases to land**" - Refers to landfilling, land treatment/application farming, surface impoundment or any other releases of a toxic chemical to land within the boundaries of a facility.

## **FACILITIES COVERED**

Facilities subject to reporting under Section 313 are those that have 10 or more full-time employees, that are in primary SIC codes 20 through 39, and that manufactured, processed or otherwise used a listed toxic chemical or chemical category in excess of specified threshold quantities.

The thresholds for reporting are different for users and manufacturers or processors of chemicals. For 1989 and subsequent reporting years, facilities using listed toxic chemicals in quantities over 10,000 pounds and facilities manufacturing or processing these chemicals in excess of 25,000 pounds are required to submit a Form R to both the Illinois EPA and the U.S. EPA by July 1 of the following year.

The SIC codes, which partly determine coverage, exclude utility companies, POTWs, and waste treatment, storage and disposal facilities from reporting under Section 313.

#### COMPLIANCE

In order to manage and process all of the data being supplied by industry under Section 313, the Illinois EPA developed a system of quality control. Obvious errors in the submissions were considered to be either "entry" or "technical" errors.

"Entry" errors, such as pages missing from the Form R or a submittal on a wrong form, prohibited the data from being entered into the Agency's computer database. The Illinois EPA contacts the facility with a letter or by phone asking the owner or operator to correct the noted deficiency.

"Technical" errors are handled much the same way; however, the Agency is able to initially enter the data in the computer for later edits once the facility provides the correct information. It has been noted that numerous "technical" errors are made by facilities in the areas of CAS numbers and chemical name spellings.

To ensure data accuracy and completeness and timely submission of data, various compliance activities are planned or have been carried out.

#### LIMITATIONS ON USE OF INFORMATION

It is emphasized that the reported toxic chemical release information on which this annual report is based includes total annual amounts of specific chemicals which are released to the environment. Reporting of information about concentrations or rate of release of toxic chemicals is not currently required. For that reason, this information cannot be used to assess specific instances of chemical exposure. Other factors such as meteorologic information must be known as well for such an assessment. See the next section for additional information.

#### CHEMICAL HAZARD ASSESSMENT

Having the data now available under EPCRA is only the first step in assessing the potential chemical hazards in Illinois. In order to comprehend this information and begin to realize how it may impact communities, other factors must be considered. The chemical properties and associated toxicology of the chemicals of concern should be considered.

## TOXICOLOGY

In order to assess the significance of a chemical release of any kind, it is necessary to discuss some fundamentals of toxicology. Above all, it is necessary to appreciate the most basic concept of toxicology, "the dose makes the poison."

This fact indicates that all substances are poisons, even common items like table salt and sugar, if the dose is high enough. On the other hand, some substances are poisonous at relatively low doses. Many of the chemicals addressed by EPCRA Section 313 fall into this category.

Even with relatively poisonous substances no harm can occur unless there has been exposure to the substance (the dose). If there is no exposure, no matter how potent the poison, there can be no toxic response. For most types of chemical exposures, the body has defense mechanisms to protect against or repair the damage done by the chemical. As long as the protection and repair mechanisms are able to keep up with the effects of the chemical, no adverse effect is seen.

Once this threshold is exceeded, however, the magnitude of the response will be in direct proportion to the magnitude of the exposure. Eventually, if the exposure is long enough or severe enough, the chemical causes failure of some organ or organ system, resulting in incapacitation and ultimately death of the organism. This points out two concepts in toxicology, the concept of a threshold of toxicity and the concept of a target organ of a chemical.

For certain types of toxic actions, it is generally accepted that, in theory, any amount of toxin, even the smallest, has an effect. Certain types of cancer and reproductive effects fall into this "no threshold" category.

Specifically, it is thought that this theory pertains to damage of genetic material by chemicals, by biological agents such as certain viruses, or by physical agents such as ionizing radiation.

Repair mechanisms are known to exist for genetic material, and damage often occurs in areas of the genetic material having no expressed function. Nevertheless, the theory holds that even one unrepaired injury to a key area of the genetic material can result in a mutated cell. If this cell continues to divide, it will produce a colony of genetically different cells. The consequences of this type of damage can be expressed as a birth defect, a mutation, a tumor, or the damage can cause a "silent mutation" in which there is no obvious effect (if the damage occurs in an area of the genetic material having no expressed function).

Since it is impossible to detect a single injury or even small numbers of injuries to the genetic material at this time, scientific studies to determine whether a chemical can cause genetic damage are designed to expose laboratory test organisms to high doses of the chemical in order to maximize the chances of seeing a response. For cancer tests, the results of positive tests at the high doses (doses which are almost always much larger than expected levels of human exposures) are then extrapolated downward to doses which are relevant to expected human exposures.

These extrapolations are usually expressed as the extra risk of contracting cancer above the "background" cancer incidence due to exposure to low levels of the chemical, such as one extra chance in 100,000 or one in a million. An extra risk of one chance in a hundred thousand or one in one million is generally considered insignificant, since there exists for everyone a similarly small, unavoidable risk of death due to natural disasters such as floods, tornadoes, lightning, etc.

These concepts of:

- 1. "the dose makes the poison";
- 2. the requirement for a route of exposure;
- 3. there may be specific target organs for a chemical;
- 4. thresholds exist for some responses; and
- 5. there are insignificant risk levels for those chemicals for which no threshold is thought to exist;

are concepts which may be used as part of the regulatory control strategy for releases of toxic chemicals to the environment.

As a result of spills, derailments, past disposal practices, industrial accidents, illegal dumping, etc., environmental, public safety and health agencies must on occasion respond to unplanned chemical releases to the environment. In fact, accidental conditions which result in major releases of toxic chemicals to the environment were the driving force behind passage of EPCRAs Community Right-to-Know requirements.

In cases of chemical emergencies it is critical to know the chemical, physical and toxicological properties of the chemical(s) released so that appropriate counter-measures can be undertaken as soon as possible. Knowledge of all important routes of exposure, any critical target organs, any especially sensitive populations, threshold and acutely toxic levels, and antidotes are all important in planning what to do should an emergency arise.

Even in cases which are not of an emergency nature, such as some spill cleanups, illegal dumpings or past disposal practices, it is important to know the toxicological properties of the chemicals involved. Relevant routes of exposure, sensitive organs or populations, threshold levels or levels of insignificance, and the potential fate of the chemicals in all environmental media are important subjects which must be addressed in assessing the amount of cleanup which may be necessary in the incident. In some cases, where similar-acting chemicals are involved, special care must be taken to account for additive effects on sensitive organs.

Information on the toxicological aspects of many chemicals of concern and on toxicology in general can be obtained from the references listed in Appendix B. In addition, Illinois EPA has produced Chemical Information Sheets for certain chemicals which are listed in EPCRA Section 313. This information is summarized in Appendix C.

Many references are available which explain the properties and usage of various chemicals. An abbreviated listing of these references is presented in Appendix D.

## **ILLINOIS EPA REGULATORY PROGRAMS**

The Illinois EPA operates a number of programs which identify, limit, monitor or otherwise control releases of various chemicals including many toxic chemicals regulated under Section 313. The following is a brief summary of those programs.

## **Bureau of Air**

*Pollutant Monitoring* - A statewide system of air monitoring instruments provides information on various air pollutants either continuously or every two to six days depending on instrument operation.

*Permitting* - Permits are required for processes and machinery that emit air pollutants. Permit conditions are imposed which are designed to ensure that state emission restrictions are met. Approximately 16,000 such operating permits have been issued for 9,386 facilities in Illinois.

Chemical releases to the air can occur from point sources such as stacks and vents or from non-point (fugitive) sources such as emissions from open-top holding tanks, wastewater streams or ponds, or from production losses. If these releases are subsequently captured or destroyed, no exposure occurs and, therefore, no toxic response is possible.

For some permitted releases, permit requirements are written to control chemicals of toxicological importance to the extent possible such that any exposure would be at a level of insignificance to the general public. Certain releases not covered by permits can be monitored by the Agency's statewide air monitoring network.

*Air Toxics Program* - The Agency is delegated to implement and enforce the federal standards under Section 112 of the CAAA which limit the air releases of Hazardous Air Pollutants (HAPs). Expanded air toxics regulation has been authorized by legislation which added Section 9.5 to the Illinois Environmental Protection Act for the purpose of identifying and limiting releases of toxic air contaminants. Pursuant to Section 9.5, the Agency has evaluated a number of toxic air contaminants. As a result of this evaluation, a revised list of 343 chemicals and compounds has been adopted by the Illinois Pollution Control Board (IPCB) as the Illinois Toxic Air Contaminants List. The list consists of Illinois Toxic Air Contaminants, Hazardous Air Pollutants (HAPs) and Great Lakes and Great Waters pollutants.

*Compliance/Enforcement* - More than 3,000 facility inspections are conducted each year to verify compliance with regulations and permit conditions. Violations are referred to the Office of the Attorney General for prosecution.

#### **Bureau of Land**

*Pollutant Monitoring* - Information on waste stream characteristics, groundwater quality, hydrological and geological parameters and soil contamination are collected by the Illinois EPA and in many instances are also supplied to the Illinois EPA by regulated facilities.

*Permitting* - Permits are required for persons who treat, store or dispose of certain wastes. Applicants have to demonstrate that landfills are properly designed and constructed so as to prevent or minimize any adverse impacts to human health or the environment. In addition, any special wastes, industrial process, pollution control residual or hazardous wastes, have to be properly identified and analyzed before they can be permitted to be landfilled. In many cases, hazardous wastes have to be recycled, incinerated, treated to certain standards or rendered non-hazardous prior to landfilling. Permits for land disposal facilities require the applicant to monitor groundwater and submit reports to the Agency. The groundwater monitoring programs thus identify whether there have been releases from regulated facilities, and the need for remedial action. Permits have been issued to approximately 190 public and private waste treatment, storage and disposal facilities.

*Compliance/Enforcement* - To ensure that treatment, storage and disposal facilities continue to meet interim or final operating, monitoring and reporting requirements, on-site investigations, sampling visits and records review are done to verify compliance with regulations and permit conditions. Through non-compliance letters, meeting with the facilities and appropriate referral of enforcement actions compliance is tracked and maintained.

*Resource Conservation and Recovery Act (RCRA)* - Subtitle C of RCRA provides the authority for the development and implementation of a comprehensive hazardous waste management program. The intent of the Act is to control hazardous wastes; to eliminate environmentally unsound disposal practices; to increase the opportunity for resource conservation and recovery; and to provide for the environmentally acceptable disposal of hazardous wastes.

The Hazardous and Solid Waste Amendments to RCRA in 1984 include, among other changes, the authority to make a facility take corrective action for any release.

Subtitle D of RCRA establishes a voluntary program through which states receive federal technical support to develop and implement solid waste management plans. These plans are intended to promote waste reduction and recycling of solid wastes, and require the closing or upgrading of all environmentally unsound dumps. Additionally, minimum technical standards are in place for all solid waste landfills.

Approximately 200 facilities are subject to regulation under the provisions of RCRA.

#### **Bureau of Water - Division of Water Pollution Control**

*Pollutant Monitoring* - A statewide network of 207 stream monitoring locations is routinely used to assess physical, chemical, biological and bacteriological properties of all surface water and also provides information on ambient conditions and water quality trends. This network is augmented by periodic intensive surveys of the 15 major river basins in the state as well as ongoing programs to measure pollutant levels in sediment and fish flesh.

*Permitting* - Specific pollutant concentration and mass limitations and monitoring/reporting requirements are incorporated into permits for discharge to surface waters for the approximately 2500 municipal, industrial and commercial dischargers in the state. Chemical releases to surface waters may be permitted if it can be shown that the release will conform to state and federal requirements for technology-based treatment and will not cause or contribute to violations of water quality standards established by the IPCB to protect designated uses of these waters. Thus, it may be required that the chemical be treated, removed, broken down or otherwise controlled to a

point where the remaining amount will not be harmful to humans, fish and other aquatic life and wildlife, depending on the designated use of the body of water. Revisions of the toxic provisions of the state's water quality standards currently before the IPCB are designed to increase the Agency's ability to protect these waters.

*Compliance/Enforcement* - Field staff visit several hundred facilities a year to determine compliance with permit conditions. Sampling by field staff and subsequent analyses characterize the chemical and physical makeup of the discharge. Biomonitoring and facility-related stream surveys are also used to quantify this impact on aquatic life in the receiving stream. Self-monitoring reports submitted by facilities, as required by permits, are evaluated for compliance. Unresolved violations are referred to the Office of Attorney General for prosecution.

## **Bureau of Water - Division of Public Water Supplies**

*Pollutant Monitoring* - Monitoring is conducted through regular testing of samples of raw and treated water from each public water supply. Testing includes microbiological, inorganic and organic chemicals, and radiological parameters.

*Permitting* - Owners or official custodians of facilities that wish to install new equipment or water mains or to modify existing equipment or distribution systems are required to obtain a construction permit. Once construction has been completed, an operating permit must be obtained prior to start of operation before putting new construction into operation. Agency personnel review permit applications to insure proper system design and compliance with applicable regulations. Approximately 1,930 community water supply systems throughout the state are subject to the construction and operating permit requirements of the Agency. Permits are also issued for algae control, for pesticide application upstream of public water supply intakes, and for the waste disposal permit requirements that apply to public water supply treatment wastes.

The Agency administers the minimum and maximum setback zone procedures, which provide for a buffer area between public water supply wells and sources of possible chemical contamination of those wells, and is responsible for the hazard certification program, which registers all sites posing minimum hazard and provides an exemption from setback requirements.

*Compliance/Enforcement* - Agency field personnel regularly inspect public water supply systems and also respond to complaints and requests for assistance. Technical assistance provided by the Agency has proven to be extremely cost effective in helping supplies maintain adequate operations. In addition, other aspects of the groundwater protection program are conducted by the Agency. In cases of violations of water supply standards, permit requirements or certification requirements, the Agency will initiate enforcement action through the Office of the Attorney General.

#### **Chemical Safety**

*Emergency Response* - Regulations require immediate reporting of emergency releases of many chemicals to the state. The Illinois EPA works within the State response system to provide technical advice to spillers and responding governmental units during response, mitigation and cleanup of incidents involving chemical emergencies. Over 2400 such incidents were handled by the Agency in 1996.

*Emergency Preparedness* - The Agency also administers certain provisions of the Illinois Chemical Safety Act (ICSA). The ICSA requires facility contingency planning for dealing with releases of chemical substances, and provides for review and recommendations for improvement of contingency plans by the Illinois EPA following significant releases of chemical substances. Approximately 2,300 facilities are regulated under the provisions of the ICSA.

*Federal PCB Compliance* - The use of certain toxic substances such as Polychlorinated Biphenyls are regulated by the federal government under the authority of the Toxic Substances Control Act. Pursuant to a cooperative agreement, OCS staff conduct compliance inspections of such substances for the U.S. EPA who initiate any subsequent enforcement actions. This is one of the few Agency programs that addresses the use aspect of chemicals in contrast to addressing them as a waste, release or residue.

*Compliance/Enforcement* - Spills reported as emergencies are evaluated to determine the need for prevention and remediation measures. Cooperation is achieved in most cases, but formal compliance actions or even referral for prosecution are sometimes necessary to obtain the desired relief.

## **Pollution Prevention**

The Illinois Pollution Prevention Act was passed in 1992. This act may lead to new approaches to preventing pollution in Illinois. The Toxic Pollution Prevention Act of 1989 provides that manufacturing industries in Illinois may elect to develop toxic pollution prevention innovation plans in order to reduce the releases of toxic substances by various manufacturing processes which operate in the state. The Illinois EPA is to concur in innovation plans which will be effective in preventing toxic pollution, provided the plan will achieve the level of toxic pollution prevention of other available processes, and provided the plan will not reasonably be expected to have any significant adverse effect on public health or the environment.

The Illinois Materials Exchange Service, operated by the Agency, identifies potential waste materials for which a facility is attempting to find a potential user so that the materials can be recycled instead of being discarded as a waste. The Illinois EPA also identifies potential waste materials which are being sought by facilities for use in their process as a raw material.

The Illinois EPA also operates an internship program in cooperation with several universities, in an effort to work with Illinois industries to identify opportunities to reduce the generation of waste through the manufacturing process.

## **UTILIZATION OF FORM R DATA**

Data reported on Form R has been utilized in many ways. Some examples are as follows:

## AIR TOXICS PROGRAM

Illinois EPA's Bureau of Air utilizes the Agency's Section 313 database to determine quantities of stack and fugitive air emissions of reported substances to support continuing development of regulatory proposals in response to legislation passed in 1987 to address air toxics. The Bureau of Air also utilizes Form R data to identify facilities for regulation under delegated provisions of the federal Clean Air Act Amendments.

#### ILLINOIS CHEMICAL SAFETY ACT (ICSA)

Section 313 (Form R) data is utilized in the process of adding facilities for coverage under the ICSA. Form R data is also being reviewed to determine compliance with the ICSA by facilities reporting under Section 313.

#### **STORM WATER PERMITS**

Form R data is used to identify facilities for storm water permitting activities under the federal Clean Water Act Amendments.

## HAZARDOUS WASTE SITE OPERATIONS

Form R information is used by the Illinois EPA's Bureau of Land to identify toxic chemicals present at hazardous waste sites for a number of programmatic reasons.

#### POLLUTION PREVENTION

Form R data is being used to prioritize facilities for initiatives contained in the Illinois Toxic Pollution Prevention Act. Beginning with reporting year 1991, Form R data is being utilized as a tool for analyzing pollution prevention efforts.

## NON-ROUTINE RELEASES

Beginning with reporting year 1991, Form R information is being utilized to verify that appropriate emergency notification has been given by facilities which have experienced non-routine releases of toxic chemicals.

#### FREEDOM OF INFORMATION ACT

Various individuals and citizen groups have requested Form R data for a variety of purposes, including generation of a report to a citizen groups constituency. Many such requests are made to support site investigations related to property transfer.

#### ENVIRONMENTAL TOXICOLOGY ACT

The Illinois Department of Public Health may use Form R data as input to the health assessments mandated by this Act for Superfund and Clean Illinois sites.

#### HEALTH AND HAZARDOUS SUBSTANCES REGISTRY ACT

The Illinois Department of Public Health has requested and received Form R data to use as inputs to this Registry.

#### INFORMATION SUPPORT DURING CHEMICAL EMERGENCIES

The Illinois EPA has used Form R data to determine what chemicals might have been released during facility chemical emergencies involving fire or explosion.

## LOCAL SAFETY ACTIVITIES

In addition to handling planning and response activities under the Illinois Chemical Safety Act, local governments have been actively developing and pursuing emergency response and preparedness capabilities under Title III. Local officials used Form R data as input to their emergency response plans.

#### CHEMICAL EXPOSURE SCREENING

Local public health departments have requested identification of facilities in a certain area which release specific chemicals for the purpose of targeting exposure screening for facility employees.

## ENVIRONMENTAL PERFORMANCE

The Illinois EPA uses Form R data as indicators of environmental performance in its Annual Environmental Conditions Report.

## **OTHER USES**

An industrial trade association has requested pollution prevention information from Form Rs for some of its member facilities.

Form R data from the Illinois Toxic Chemical Inventory has been provided to be used, along with other data, to analyze critical environmental trends in Illinois.

U.S. EPA has requested Illinois Form R data to support such efforts as the 33/50 voluntary toxic release reduction program, at times before federal data was available.

Utility companies in Illinois have requested Form R information for their customers to support them in release reduction.

## **ANALYSIS OF FORM R INFORMATION**

## **CHANGES IN REPORTING REQUIREMENTS**

The following changes have been made by U.S. EPA for calendar year 1996:

• The following special chemicals have been delisted: Bis(2-ethylhexyl)adipate (CAS #000103-23-1) Diethyl Phthalate (CAS #000084-66-4)

A number of requests have been made to report toxic chemical release totals by county. Therefore, a new Appendix E has been added which lists total releases and transfers for each county from 1988 through 1996.

## **CALENDAR YEAR 1996**

## BASIS

For the current calendar year analysis, all valid reports for chemicals reportable in 1996 are included in the release and transfer totals. This includes both new chemicals (reportable for the first time in 1996) and chemicals which may be reportable in a different form than when they were first listed. For this reason, release totals in this section differ from those given for 1996 in the "Trend Analysis, 1988-1996" section.

## FACILITIES

## **Total Releases and Transfers**

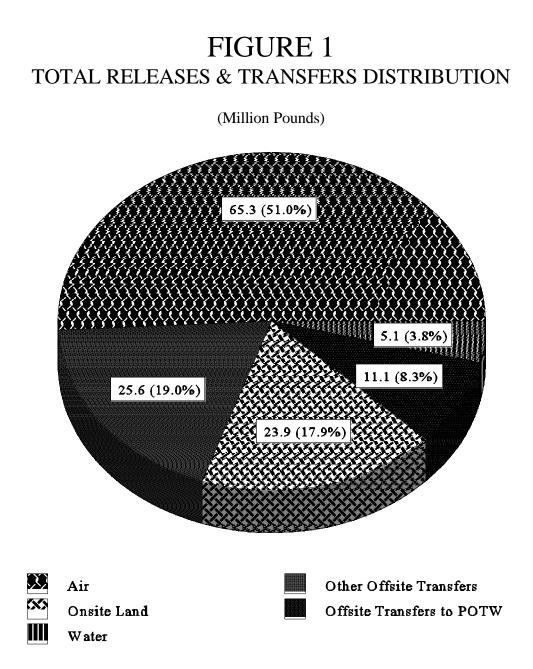

For calendar year 1996, 1,128 facilities submitted 3,602 toxic chemical release reports totalling 133.9 million pounds.

Table 1 lists the facilities reporting the top 20 total release and transfer amounts, not including offsite transfers for recycle or energy recovery.

Table 1 Total Releases and Transfers (Million Pounds) Top 20 Facilities

|                                  | _            | Releases |      |            |         |        | s To   | otal    |       |

Figure 1 shows the distribution of total releases and transfers for 1996.

\* Underground Injection is virtually zero for all years.

CHEMICALS

Releases and transfers of 193 different toxic chemicals and categories during 1996 were reported by Illinois facilities. Table 2 lists release and transfer information for the 20 chemicals with the highest reported total amounts.

## Table 2 Total Releases and Transfers (Million Pounds) Top 20 Chemicals

## STANDARD INDUSTRIAL CLASSIFICATION (SIC) CATEGORIES

Facilities in 226 individual four-digit SIC codes have reported toxic chemical releases and transfers for calendar year 1996. Table 3 summarizes the information for the 20 SIC codes reporting the highest release and transfer totals.

## TREND ANALYSIS, 1988-1996

## BASIS

Reporting of toxic chemical release information as required by Section 313 of EPCRA began with reports for calendar year 1987. In that time period, there have been many additions to and deletions from the list of toxic chemicals, and allowances have been made for reporting only certain forms of selected chemicals. Coupled with the facts that the quality of data reported for 1987 is questionable and that reporting threshold amounts decreased from 1987 to 1989, it is nearly impossible to evaluate trends using <u>all</u> reported information from <u>all</u> facilities for <u>all</u> years.

Considering the dynamic nature of the Form R reporting program, in order to perform meaningful analyses of toxic chemical releases, especially with regard to evaluating release trends, the Illinois EPA utilizes information provided by facilities for toxic chemicals which have been reportable in the same form for all years, 1988 through 1996. Offsite transfers for recycle or energy recovery, which were reportable beginning with calendar year 1991, are not considered in trend analysis for this period. Other reported information may be used, as indicated, to illustrate specific points.

Illinois toxic chemical release data trends are analyzed from several different perspectives in this annual report, including specific facilities, specific chemicals, SIC code groups and ZIP codes. In each of these, separate analyses are shown for: (1) all reported chemicals; and for (2) those reported chemicals which are known to have "significant" human health effects (i.e., are known or probable human carcinogens, teratogens, reproductive toxins or fetal toxins). For display purposes, release amounts are shown for the base year, 1988, and for the last five years.

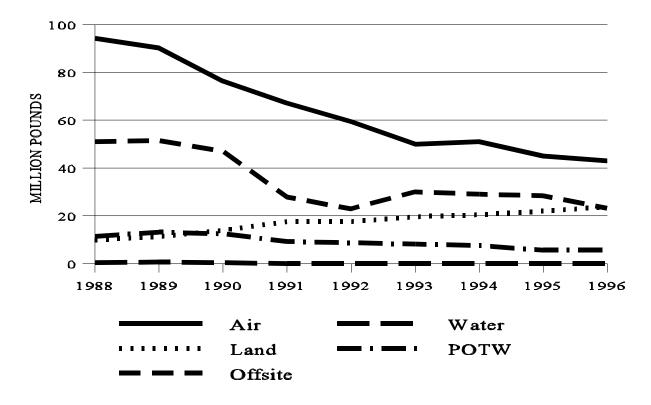

A number of chemical categories, which are primarily metal compounds, have been reportable beginning with reporting year 1987. USEPA did not assign identifying codes for those categories until 1991. For that reason, the Illinois EPA used the CAS number for the parent metal for the metal compounds and combined the release amounts of this parent metal and its compounds in data analysis presented in the First through Ninth Annual Toxic Chemical Reports. Beginning with this Tenth Annual Toxic Chemical Report, the chemical categories will be presented separately.

## **SUMMARY**

Figures 2 and 3 summarize the overall totals for releases and transfers from 1988 through 1996.

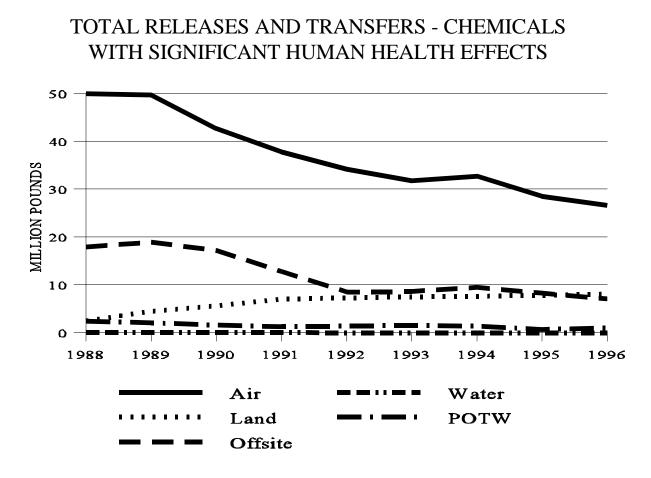

# FIGURE 2

## TOTAL RELEASES AND TRANSFERS -ALL CHEMICALS

\* Underground Injection is virtually zero for all years.

# FIGURE 3

## \* Underground Injection is virtually zero for all years.

## FACILITIES

Tables 5 through 12 list information about facilities which have filed one or more Form Rs each year 1988 through 1996 for toxic chemicals reportable each year in the same form. The "Totals For All Reporting Facilities" are for all facilities which reported toxic chemicals which were reportable in the same form each year.

## **Total Releases and Transfers**

Facilities reported releases totalling 1,138.6 pounds from 1988 through 1996. During this period, the top 20 facilities accounted for approximately 42 percent of those releases and transfers, as shown in Table 5.

## Table 5

Considering only toxic chemicals known to have significant human health effects, facilities reported total releases and transfers of 414.3 million pounds during those same years. The top 20 facilities accounted for 56% of that total, as shown in Table 6.

## **Increases in Releases and Transfers**

Release and transfer amounts reported by a number of facilities increased from 1988 through 1996. Table 9 shows the top twenty facilities ranked according to total release and transfer increases in pounds per year for the eight-year period.

## Table 9

## Total Release and Transfer Increases Top 20 Facilities

#### **Pollution Prevention Efforts**

Reporting of information about source reduction (pollution prevention) efforts has been required beginning with reporting year 1991. 809 facilities have indicated undertaking such activities for one or more years from 1992 through 1996. The top twenty facilities in this category are shown in Table 11.

The fact that a facility claimed source reduction activities for a chemical does not necessarily mean that the reduction in releases and transfers of the chemical are attributable to those activities.

## Table 11

#### Significant Environmental Achievement

A number of the facilities which have submitted toxic chemical release reports every year since 1988 have demonstrated performance which sets them apart from other facilities. Several criteria have been considered to identify these facilities:

- Toxic chemical release and transfer reduction greater than 1 million pounds, 1988 through 1996 (most current information)
- Low or decreasing number of accidental chemical releases, 1992-1997 (most current information)
- No significant releases as defined by the Illinois Chemical Safety Act (ICSA) from 1992 through 1997
- Participation in the Agency's voluntary Partners in Pollution Prevention program

The seven facilities meeting these criteria are listed in Table 13.

#### Table 13

### CHEMICALS

Approximately 330 toxic chemicals and chemical categories have been reportable on Form R in the same form from 1988 through 1996. A total of 136 of these have been reported in Illinois every year.

Tables 14 through 25 summarize toxic chemical release and transfer amounts for each environmental media. The top twenty chemicals are listed for each media unless a smaller number of chemicals had non-zero release and transfer amounts.

# STANDARD INDUSTRIAL CLASSIFICATION (SIC) CATEGORIES

Facilities in 188 individual four-digit SIC codes have reported toxic chemical releases from 1988 through 1996. Tables 26 and 27 summarize the release and transfer information for these SIC codes.

#### Table 26

# Total Release and Transfer Amounts Top 20 SIC Codes

#### **ZIP CODES - AIR EMISSIONS**

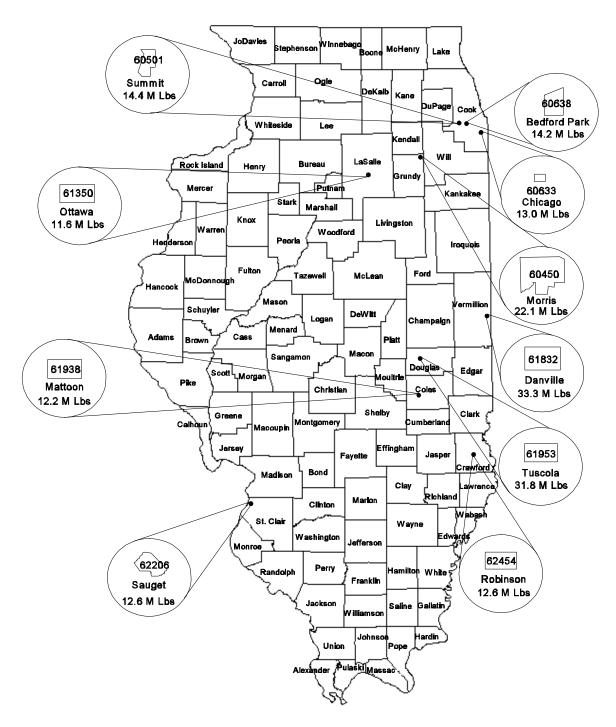

The geographic analysis of information in past reports has been summarized on a county basis. In an attempt to localize the reported information in an understandable format, the following summaries of toxic chemical release information presented in Tables 28 and 29 are based on five-digit zip codes. Also, the analysis presented here is restricted to air emissions to give some indication of the possibility of human exposure. Of course, ZIP code areas vary in size and population. Also, as the case has always been, toxic chemical release and transfer amounts are annual totals, so no inferences can be made from the following rankings relative to exposure dose and resultant human health effects of these air emissions in any of the ZIP codes listed. Figures 4 and 5 show the geographic location of the top ten ZIP codes, respectively, from Tables 28 and 29.

#### Table 28

# CUMULATIVE TOTAL OF AIR EMISSIONS 1988-1996 TOP 10 ZIP CODES CHEMICALS WITH SIGNIFICANT HUMAN HEALTH EFFECTS

#### **GENERAL TRENDS**

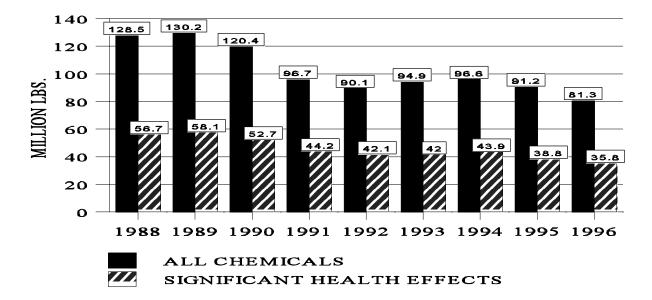

The following charts depict the general trends of toxic chemical release information from 1988 through 1996. Figure 6 indicates the number of reporting facilities in each year. Figure 7 shows total releases and transfers for only the 798 facilities reporting all nine years. Figure 8 shows totals for all reporting facilities for those years. Figures 9 through 13 show the totals for each release and transfer route.

# **APPENDIX C - CHEMICAL INFORMATION SHEETS**

Chemical information sheets for the following chemicals are available from the Illinois EPA, Office of Chemical Safety:

Alachlor Aldrin/Dieldrin Ammonia Arsenic Benzene 1,3-Butadiene Cadmium Carbon Monoxide Carbon Tetrachloride Chloroform Chromium Coal Tar Creosote Cyanide Dichlorobenzenes Dichloroethanes Dichloroethylenes Di(2-ethylhexyl)phthalate Ethylbenzene Lead Mercury Methylene Chloride Methyl Ethyl Ketone Methyl Isobutyl Ketone Naphthalene Nickel Ozone Pentachlorophenol Polychlorinated Biphenyls Polychlorinated Dibenzodioxins and Dibenzofurans Polycyclic Aromatic Hydrocarbons Sulfur Dioxide Tetrachloroethylene Toluene Triazine Herbicides 1,1,1-Trichloroethane Trichloroethylene Trifluralin Vinyl Chloride Xylene Glossary

The glossary of terms and the chemical information sheet for Ammonia are included as examples. For further information, please write to:

Office of Chemical Safety Illinois Environmental Protection Agency P. O. Box 19276 1021 N. Grand Avenue East Springfield, Illinois 62794-9276

# GLOSSARY

*absorption* - the movement of a chemical into the bloodstream or other body fluid or tissue after its entrance into the body through the skin, lungs or gastrointestinal tract.

*acute* - sharp, severe; having a relatively rapid onset, often with severe symptoms and a relatively short course. In toxicology refers to a single large exposure to a chemical (acute exposure), or to the development of symptoms of poisoning soon after a single exposure to a substance (acute toxicity).

*ACGIH* - the American Conference of Governmental Industrial Hygienists. It recommends upper limits (see TLV) for exposure to workplace chemicals.

*bioconcentration* - the process in and by which chemical substances are accumulated in living organisms above their concentration in the environment. For example, a chemical is spilled into a river or lake and is ingested and stored by small organisms like plankton; small fish eat the plankton; and large fish eat the smaller fish. As this process occurs, the chemical becomes thousands of times more concentrated in the tissues of the large fish than in the plankton or the water. Usually occurs with fat-soluble compounds rather than water-soluble compounds.

*biodegradation* - the breaking down of an organic substance, resulting from the complex action of living organisms.

cancer - a group of diseases characterized by malignant, uncontrolled growth of cells of body tissue (tumors).

*carcinogen* - a term applied generally to any substance that is capable of producing cancer or increasing the growth and spreading of tumors in an organism.

*chronic* - occurring over a period of time. In toxicology refers to repeated exposure (chronic exposure) to a chemical for a relatively long period of time or persistence of symptoms or disease over a long period of time (chronic toxicity).

epidemiology - the study of the incidence, distribution and control of disease in human populations.

*leaching* - downward movement of a material in solution through soil.

*Maximum Contaminant Level (MCL)* - the maximum permissible level of a contaminant that is allowed in a public water supply system.

*metabolism* - the changes that a chemical undergoes in an organism. The products of metabolism may be more or less active in the organism than the original (parent) compound. In animals, many of these products find their way to body excretions, for example through lung exhalation, urine or feces. Tracing the pathways of metabolism is important to shed light on possible relationships between chemicals and particular health effects.

mg/m3 - means milligrams of a chemical in a cubic meter of air. It is a density measurement expressing the amount of air pollutant in a given volume of air.

*mutagen* - a substance that causes a change in the genetic material in a body cell, called a mutation. Mutations may lead to birth defects, miscarriages or cancer, or they may have no obvious effect, depending on what genetic material is damaged and on where the damage occurs.

*persistent* - existing for a long time in the environment or the body. For chemicals, this means not easily broken down; for the effects of the chemical, this means the effect remains or recurs long after exposure to the chemical.

*pesticide* - a general term used to describe a product designed to kill or control unwanted organisms; for example, herbicides are designed to control unwanted plants, insecticides are designed to control unwanted insects, fungicides are designed to control fungus, mold, etc.

*ppb* - an expression describing a small concentration, equal to an amount of one substance in a billion parts of another material; for example, one drop of alcohol in 16,000 gallons of water.

*ppm* - an expression describing a small concentration, equal to an amount of one substance in a million parts of another material; for example, one drop of alcohol in 16 gallons of water.

solvent - a liquid substance capable of dissolving or dispersing one or more other substances.

teratogen - a substance that causes stillbirths, birth defects, or malformations by affecting the growing fetus.

*TLV* - is the Threshold Limit Value for air. The TLV is a workplace exposure limit recommended by ACGIH and represents conditions under which it is believed that nearly all workers may be repeatedly exposed to a substance day after day without adverse effect.

toxicology - the study of the adverse effects of chemicals on living organisms.

volatile - readily vaporizable at a relatively low temperature.

The following information is an example of readily available data regarding the general nature and effects of trichloroethylene. The reader is encouraged to consult other sources or an appropriate professional if a more detailed explanation for specific concerns is desired.

### WHAT IS TRICHLOROETHYLENE?

Trichloroethylene (TCE; trichloroethene; ethylene trichloride) is a nonflammable, highly volatile, colorless liquid used extensively for degreasing of fabricated metal parts. It has been estimated that from 80 to 95 percent of the TCE produced in the United States is used in the degreasing process. The remaining 5 to 20 percent is either exported or used for miscellaneous applications. Miscellaneous uses of TCE include paint-stripping formulations, adhesive formulations, carrier solvent in industrial paint systems, and a solvent in textile dyeing and finishing. TCE has been discontinued in the United States for use as an inhalation anesthetic, in fumigant mixtures, and as an extractant in the decaffeination of coffee because of environmental and health restrictions.

Trichloroethylene has been produced commercially in the United States since 1925 and is also produced in Europe and Japan. The production of TCE has been declining in recent years due primarily to legislation restricting its use and emissions. According to statistics published by the U.S. International Trade Commission (1982), 129,397 tons of TCE were produced in 1981.

#### HOW DOES TCE GET INTO THE ENVIRONMENT?

There are no known natural sources of TCE. TCE enters the environment through evaporation into the air during production and use. Although most environmental contamination of TCE is released to the air, it has also been found as a contaminant of rivers, lakes, drinking waters, soils, food and drink, marine and freshwater organisms, and humans. TCE in surface waters may occur as a result of direct contamination or from atmospheric contamination by rainfall. However, due to certain chemical properties, TCE is not expected to persist in the open environment. It may, however, persist for long periods of time if it becomes "sheltered" in an area of the environment where evaporation and other physical and chemical processes of removal are difficult (especially in groundwater).

#### WHAT ARE THE HEALTH EFFECTS ASSOCIATED WITH TCE EXPOSURE?

Short-term exposure -- Numerous cases of short-term and accidental exposure to TCE have been documented and provide some information about its effects on humans. These exposures usually occur through inhalation of vapors released in industrial accidents and through accidental ingestion or skin contact. Exposure to TCE vapor may cause irritation of the eyes, nose, and throat. The liquid, if splashed in the eyes, may cause burning, irritation, and damage. Repeated or prolonged skin contact with the liquid may cause inflammation of the skin.

Short-term exposure to high concentrations of TCE results in depression of the central nervous system. The symptoms most often described are mild eye irritation, nausea, dizziness, headache, tremors, and confusion. Mild irritation occurs at levels near 200 ppm (parts per million). Hand steadiness, coordination, and possibly depth perception are affected at 1000 ppm and perhaps below. If combined with alcohol ingestion, TCE can produce these effects at levels of 200 to 300 ppm. The lowest concentration to produce unconsciousness in adult humans is 3000 ppm. With high enough concentrations, one could possibly die from respiratory or cardiac failure.

Long-term exposure -- Case reports indicate that symptoms involved in short-term exposure situations also are present in long-term exposure but in more extreme and persistent forms. Extended exposure can increase the duration and intensity of nausea, dizziness, and headache, but eye irritation and sense of smell are reduced. Confusion, reduced reasoning ability, impaired short-term memory, tremors, and muscular incoordination also are reported. The minimum exposure for such complaints is difficult to estimate since such data are gathered from workplace surveys with all of the attendant problems in quantification and control. It appears that these effects, however, are absent below 85 to 100 ppm.

The mutagenic potential (capability of causing changes or transformations in genes) of TCE has been investigated by the use of several test methods and in many different organisms. The mutagenic effects were observed only at high dose levels which indicates that TCE is only weakly mutagenic. TCE has been found to cause liver tumors in mice following oral administration. The applicability of mouse liver tumors for assessing cancer risk to humans is disputed. USEPA considers the evidence sufficient to consider TCE a probable human carcinogen. Also, there is not evidence that TCE is responsible for toxicity to the embryo or developing fetus or causes overt birth defects in humans at levels below the toxicity level to the mother.

#### HOW IS TCE REGULATED?

Threshold limit values adopted by the American Conference of Governmental Industrial Hygienists refer to airborne concentrations of substances and represent conditions under which it is believed that nearly all workers may be repeatedly exposed day after day without adverse effect. The threshold limit value for TCE is 50 ppm as an average eight hour exposure limit for a 5-day workweek. A Maximum Contaminant Level (MCL) of 5 ppb (parts per billion) for TCE in drinking water has been proposed under the Safe Drinking Water Act.
